# Week 4

1/22:

# Observables and Hermitian Operators

### 4.1 Harmonic Oscillator: Raising and Lowering Operators

• Raising operator: The operator defined as follows. Denoted by  $\hat{a}_+$ ,  $a_+$ . Given by

$$\hat{a}_{+} = \frac{1}{\sqrt{2\hbar m\omega}} \left[ -i\hat{\vec{p}} + m\omega\hat{\vec{x}} \right]$$

• Lowering operator: The operator defined as follows. Denoted by  $\hat{a}_{-}$ ,  $a_{-}$ . Given by

$$\hat{a}_{-} = \frac{1}{\sqrt{2\hbar m\omega}} [i\hat{\vec{p}} + m\omega\hat{\vec{x}}]$$

• Number operator: The operator defined as follows. Denoted by  $a_+a_-$ . Given by

$$a_{+}a_{-} = \hat{a}_{+} \circ \hat{a}_{-} = \frac{1}{2\hbar m\omega} \left[ \hat{\vec{p}}^{2} + m^{2}\omega^{2}x^{2} - im\omega[\hat{\vec{p}},\hat{\vec{x}}] \right]$$

- Properties of these operators.
  - We can express  $\hat{\vec{p}}, \hat{\vec{x}}$  in terms of  $a_+, a_-$  via

$$\hat{\vec{p}} = i\sqrt{\frac{\hbar m\omega}{2}}(\hat{a}_{+} - \hat{a}_{-}) \qquad \qquad \hat{\vec{x}} = \sqrt{\frac{\hbar}{2m\omega}}(\hat{a}_{+} + \hat{a}_{-})$$

■ It follows that

$$[\hat{\vec{p}},\hat{\vec{x}}] = \frac{i\hbar}{2}[a_+ - a_-, a_+ + a_-] = \frac{i\hbar}{2}([a_+, a_-] - [a_-, a_+]) = i\hbar[a_+, a_-]$$

■ Consequently, since  $[\hat{\vec{p}}, \hat{\vec{x}}] = -i\hbar$ , we have that

$$[a_+, a_-] = -1$$

■ We also have that

$$[a_{-}, a_{+}] = 1$$

– Since  $[\hat{\vec{p}}, \hat{x}] = -i\hbar$  and  $\omega^2 = k/m$ , we have that

$$\begin{split} a_{+}a_{-} &= \frac{1}{2\hbar m\omega} \left[ \hat{\vec{p}}^{2} + m^{2}\omega^{2}x^{2} - m\hbar\omega \right] \\ &= \frac{1}{\hbar\omega} \left[ \underbrace{\frac{\hat{\vec{p}}^{2}}{2m} + \frac{kx^{2}}{2}}_{\hat{H}} - \frac{\hbar\omega}{2} \right] \\ \hat{H} &= \hbar\omega \left( a_{+}a_{-} + \frac{1}{2} \right) \end{split}$$

■ Because of the properties of  $[a_+, a_-]$  proven above, we similarly have that

$$\hat{H} = \hbar\omega \left( a_- a_+ - \frac{1}{2} \right)$$

- We can also derive this equation in a manner exactly analogous to the first one.
- How does the number operator act on the eigenstate  $|\psi_n\rangle$  of the harmonic oscillator?
  - Since  $E_n = \hbar\omega(n+1/2)$ , we have that

$$\hbar\omega \left(a_{+}a_{-} + \frac{1}{2}\right) |\psi_{n}\rangle = \hat{H} |\psi_{n}\rangle$$

$$\hbar\omega \left(a_{+}a_{-} + \frac{1}{2}\right) |\psi_{n}\rangle = \hbar\omega \left(n + \frac{1}{2}\right) |\psi_{n}\rangle$$

$$a_{+}a_{-} |\psi_{n}\rangle = n |\psi_{n}\rangle$$

- How do the raising and lowering operators act on the eigenstate  $|\psi_n\rangle$  of the harmonic oscillator?
  - Using a number of the above substitutions, we have that

$$\begin{split} \hat{H}(a_{+}\left|\psi_{n}\right\rangle) &= \left[\hbar\omega\left(a_{+}a_{-} + \frac{1}{2}\right)\right]\left(a_{+}\left|\psi_{n}\right\rangle\right) \\ &= \hbar\omega\left(a_{+}a_{-}a_{+} + \frac{1}{2}a_{+}\right)\left|\psi_{n}\right\rangle \\ &= \hbar\omega a_{+}\left(a_{-}a_{+} + \frac{1}{2}\right)\left|\psi_{n}\right\rangle \\ &= \hbar\omega a_{+}\left(a_{+}a_{-} + 1 + \frac{1}{2}\right)\left|\psi_{n}\right\rangle \\ &= \hbar\omega a_{+}\left(n + 1 + \frac{1}{2}\right)\left|\psi_{n}\right\rangle \\ &= E_{n+1}(a_{+}\left|\psi_{n}\right\rangle) \end{split}$$

– This means that  $\hat{H}$  acts on  $a_+ |\psi_n\rangle$  the same way it acts on  $|\psi_{n+1}\rangle$ . In other words, it must be that

$$a_+ |\psi_n\rangle \propto |\psi_{n+1}\rangle$$

Similarly,

$$\hat{H}(a_-|\psi_n\rangle) = E_{n-1}(a_-|\psi_n\rangle)$$

so

$$a_{-}|\psi_{n}\rangle\propto|\psi_{n-1}\rangle$$

- These actions are why  $a_+, a_-$  are called the raising and lowering operators!
- We now seek to determine the constants of proportionality.
- First off, note that  $a_+$  and  $a_-$  are adjoints, i.e.,

$$a_+^{\dagger} = a_-$$

- See Section 2.3 of Griffiths and Schroeter (2018) for a proof of this fact.
- Then for  $a_+$ , we know that if

$$a_+ |\psi_n\rangle = c_+ |\psi_n\rangle$$

then

$$\begin{split} c_+^2 &= c_+^2 \left< \psi_{n+1} | \psi_{n+1} \right> \\ &= \left< c_+ \psi_{n+1} | c_+ \psi_{n+1} \right> \\ &= \left< a_+ \psi_n | a_+ \psi_n \right> \\ &= \left< \psi_n | a_+^\dagger a_+ | \psi_n \right> \\ &= \left< \psi_n | a_- a_+ | \psi_n \right> \\ &= \left< \psi_n | a_+ a_- + 1 | \psi_n \right> \\ &= (n+1) \left< \psi_n | \psi_n \right> \\ &= n+1 \end{split}$$

so that, taking square roots,

$$c_{+} = \sqrt{n+1}$$

- By the same method — namely

$$c_{-}^{2} = \langle a_{-}\psi_{n}|a_{-}\psi_{n}\rangle = \langle \psi_{n}|a_{+}a_{-}|\psi_{n}\rangle = n$$

we can also learn that

$$c_- = \sqrt{n}$$

- Therefore,

$$a_{+} |\psi_{n}\rangle = \sqrt{n+1} |\psi_{n+1}\rangle$$
  $a_{-} |\psi_{n}\rangle = \sqrt{n} |\psi_{n-1}\rangle$ 

- Note that what we have done here to derive this fact is far more slick than working directly with the unintuitive and complicated formal definitions of  $a_+, a_-$ .
- Now is a good time to mention a bit more about Dirac notation.
  - A "ket" represents a vector in a Hilbert space, so  $|\psi_n\rangle$  demonstrates that we are talking about the wave function as a vector in the abstract linear algebra sense, not as a function  $\psi_n : \mathbb{R}^4 \to \mathbb{C}$ .
  - A "bra" represents a linear functional on a Hilbert space. In quantum mechanics, the linear functional  $\langle \eta |$  is given by

$$\langle \eta | := \int \mathrm{d}^3 \vec{r} \; \eta^*$$

- Observe that this "functional" does indeed map any  $|\psi_n\rangle$  given to it as an argument to a number  $\langle \eta | \psi_n \rangle$ !
- $|\psi_n\rangle$  can be defined in terms of  $a_+$ ,  $|\psi_0\rangle$ , and constants.
  - Observe that since  $a_+ |\psi_0\rangle = |\psi_1\rangle$  and  $a_+ |\psi_1\rangle = \sqrt{2} |\psi_2\rangle$ , we have that

$$|\psi_2\rangle = \frac{a_+}{\sqrt{2}} |\psi_1\rangle = \frac{a_+^2}{\sqrt{2}} |\psi_0\rangle$$

- Similarly,

$$|\psi_3\rangle = \frac{a_+}{\sqrt{3}} |\psi_2\rangle = \frac{a_+^3}{\sqrt{3 \cdot 2}} |\psi_0\rangle$$

- Generalizing, we have that

$$|\psi_n\rangle = \frac{a_+^n}{\sqrt{n!}} |\psi_0\rangle$$

• Thus, we have that

$$\psi_n(x) = \left(\frac{1}{\sqrt{2\hbar m\omega}}\right)^n \frac{1}{\sqrt{n!}} \left(-\hbar \frac{\mathrm{d}}{\mathrm{d}x} + xm\omega\right)^n \psi_0(x)$$

where we may recall that

$$\psi_0(x) = \left(\frac{m\omega}{\hbar\pi}\right)^{1/4} e^{-m\omega x^2/2\hbar}$$

- Final observations about the raising and lowering operators.
  - Since  $a_{-}|\psi_{0}\rangle = 0$  (as we may readily verify by direct computation), we have that

$$\hbar \frac{\mathrm{d}\psi_0}{\mathrm{d}x} + m\omega x\psi_0 = 0$$

- We also know that

$$d(\ln(\psi_0)) = -\frac{m\omega}{\hbar} \frac{dx^2}{2}$$
$$\psi_0 \propto e^{-m\omega x^2/2\hbar}$$

SO

- What is the point of this line?? What new information does it give us?
- Raising and lowering operators allow us to compute the kinetic and potential energy of the harmonic oscillator.
  - Kinetic energy.

$$\begin{split} \left\langle \psi_n \left| \frac{\vec{p}^2}{2m} \right| \psi_n \right\rangle &= -\frac{\hbar \omega}{4} \left\langle \psi_n | (a_+ - a_-)^2 | \psi_n \right\rangle \\ &= -\frac{\hbar \omega}{4} \left\langle \psi_n | a_+^2 + a_-^2 - a_+ a_- - a_- a_+ | \psi_n \right\rangle \\ &= -\frac{\hbar \omega}{4} \left[ \underbrace{\left\langle \psi_n | a_+^2 | \psi_n \right\rangle}_{\propto \left\langle \psi_n | \psi_{n-2} \right\rangle} + \underbrace{\left\langle \psi_n | a_-^2 | \psi_n \right\rangle}_{\propto \left\langle \psi_n | \psi_n \right\rangle} - \underbrace{\left\langle \psi_n | a_+ a_- | \psi_n \right\rangle}_{2n \left\langle \psi_n | \psi_n \right\rangle} - \underbrace{\left\langle \psi_n | 1 | \psi_n \right\rangle}_{\left\langle \psi_n | \psi_n \right\rangle} \right] \\ &= \frac{\hbar \omega}{4} (2n+1) \\ &= \frac{\hbar \omega}{2} \left( n + \frac{1}{2} \right) \\ &= \frac{E_n}{2} \end{split}$$

Potential energy.

$$\langle \psi_n | \hat{H} | \psi_n \rangle = E_n$$

$$\langle \psi_n | \frac{\hat{p}^2}{2m} | \psi_n \rangle + \langle \psi_n | \frac{k\hat{x}^2}{2} | \psi_n \rangle = \frac{E_n}{2} + \frac{E_n}{2}$$

$$\langle \psi_n | \frac{k\hat{x}^2}{2} | \psi_n \rangle = \frac{E_n}{2}$$

- Implication: In an energy eigenstate, the harmonic oscillator has equal values of kinetic and potential energies!

- Computing more observables.
  - We can show that

$$\langle \psi_n | \hat{\vec{x}} | \psi_n \rangle = \langle \psi_n | \hat{\vec{p}} | \psi_n \rangle = 0 \qquad \langle \psi_n | \hat{\vec{x}}^{\, 2} | \psi_n \rangle = \frac{\hbar \omega}{k} \left( n + \frac{1}{2} \right) \qquad \langle \psi_n | \hat{\vec{p}}^{\, 2} | \psi_n \rangle = \hbar \omega m \left( n + \frac{1}{2} \right)$$

• It follows from the above computations and the facts that

$$\Delta x^2 = \langle \psi_n | \hat{\vec{x}}^2 | \psi_n \rangle - (\langle \psi_n | \hat{\vec{x}} | \psi_n \rangle)^2 \qquad \Delta p^2 = \langle \psi_n | \hat{\vec{p}}^2 | \psi_n \rangle - (\langle \psi_n | \hat{\vec{p}} | \psi_n \rangle)^2$$

that

$$\Delta x^{2} \cdot \Delta p^{2} = \hbar^{2} \left( n + \frac{1}{2} \right)^{2}$$
$$\Delta x \cdot \Delta p = \frac{\hbar}{2} (2n + 1)$$

- Implication: The ground state  $\psi_0(x)$  is represented by a Gaussian since in this case,  $\Delta x \cdot \Delta p = \hbar/2$ .
- Review from last class.
  - Mostly stuff I already wrote down.
  - One new equation formalizing the even/odd solutions:

$$f_n(x) = (-1)^n f_n(-x)$$

- The first four Hermite polynomials:

$$H_0(\xi) = 1$$
  $H_1(\xi) = 2\xi$   $H_2(\xi) = 4\xi^2 - 2$   $H_3 = 8\xi^3 - 12\xi$ 

- Summary of the characteristics of  $E_n$ : The energy is quantized and grows linearly with n in quanta of  $\hbar\omega$ , and has a minimum value  $\hbar\omega/2$ .
- As with other time-independent potentials, the general solution to the Schrödinger equation will be

$$\psi(x,t) = \sum_{n} c_n \psi_n(x) e^{-iE_n t/\hbar}$$

where

$$\langle \psi | \hat{H} | \psi \rangle = \sum_{n} |c_n|^2 E_n$$

### 4.2 Time Dependence and Coherent States

- 1/24: Review of the harmonic oscillator.
  - Our Hamiltonian is

$$\hat{H} = -\frac{\hbar^2}{2m} \frac{\mathrm{d}^2}{\mathrm{d}x^2} + \frac{kx^2}{2} = \frac{\hat{\vec{p}}^2}{2m} + \frac{k\hat{\vec{x}}^2}{2}$$

- We have an analogy with the classical  $\omega^2 = k/m$ .
- Under this Hamiltonian,  $\hat{H} | \psi_n \rangle = E_n | \psi_n \rangle$  implies that

$$E_n = \hbar\omega \left(\frac{1}{2} + n\right)$$

- The raising and lowering operators are given by

$$a_{+} = \frac{1}{\sqrt{2\hbar m\omega}} [-i\hat{\vec{p}} + m\omega\hat{\vec{x}}] \qquad a_{-} = \frac{1}{\sqrt{2\hbar m\omega}} [i\hat{\vec{p}} + m\omega\hat{\vec{x}}]$$

■ Together, these imply that

$$\hat{H} = \hbar\omega \left( a_+ a_- + \frac{1}{2} \right)$$

■ We also have that

$$a_{+}a_{-} |\psi_{n}\rangle = n |\psi_{n}\rangle$$

$$a_{+} |\psi_{n}\rangle = \sqrt{n+1} |\psi_{n+1}\rangle$$

$$a_{-} |\psi_{n}\rangle = \sqrt{n} |\psi_{n-1}\rangle$$

- We call  $a_+a_-$  the number operator.
- We should go home and learn these formulas.
- The full eigenstate is

$$\psi(x,t) = \sum_{n=0}^{\infty} \underbrace{c_n \psi_n(x) e^{-iE_n t/\hbar}}_{\psi_n(x,t)}$$

- Two properties of this eigenstate.
  - 1. We have that

$$|\psi\rangle = \sum_{n=0}^{\infty} c_n e^{-iE_n t/\hbar} |\psi_n\rangle$$

which implies that

$$\sum_{n=0}^{\infty} |c_n|^2 = 1$$

since  $\langle \psi | \psi \rangle = 1$  and  $\langle \psi_n | \psi_m \rangle = \delta_{nm}$ .

2. We have that

$$\langle \psi | \hat{H} | \psi \rangle = \sum_{n=0}^{\infty} |c_n|^2 E_n$$

- We have that

$$\left\langle \psi_n \left| \frac{k \hat{\vec{x}}^{\,2}}{2} \right| \psi_n \right\rangle = \frac{\hbar \omega}{2} \left( n + \frac{1}{2} \right) = \frac{E_n}{2} \qquad \qquad \left\langle \psi_n \left| \frac{\hat{\vec{p}}^{\,2}}{2m} \right| \psi_n \right\rangle = \frac{\hbar \omega}{2} \left( n + \frac{1}{2} \right) = \frac{E_n}{2}$$

- Note that this makes sense because the sum  $E_n/2 + E_n/2$  of potential and kinetic should be  $E_n$ , and it will be!
- Additionally, recall that we have

$$\hat{\vec{p}}^2 \propto (a_+ - a_-)^2$$
  $\hat{\vec{x}}^2 \propto (a_+ + a_-)^2$ 

■ Thus, we have that

$$\langle \psi_n | \hat{\vec{p}} | \psi_n \rangle = \langle \psi_n | (a_+ - a_-) | \psi_n \rangle = 0 \qquad \langle \psi_n | \hat{\vec{x}} | \psi_n \rangle = \langle \psi_n | (a_+ + a_-) | \psi_n \rangle = 0$$

- The harmonic oscillator is a very important problem in physics, and we should know it by heart!
   (In order to pass the class.)
- Recall as well that there is a correspondence between the Dirac notation and the functional notation, given by

$$\psi_n(x) \mapsto |\psi_n\rangle$$

- As an additional example,

$$\frac{1}{\sqrt{2\hbar m\omega}} \begin{bmatrix} -\hbar \frac{\mathrm{d}}{\mathrm{d}x} + m\omega x \end{bmatrix} \psi_n(x) = \sqrt{n+1} \psi_{n+1}(x) \quad \mapsto \quad a_+ |\psi_n\rangle = \sqrt{n+1} |\psi_{n+1}\rangle$$

- One more example:

$$\hbar \frac{\mathrm{d}\psi_0}{\mathrm{d}x} + m\omega x \psi_0(x) = 0 \quad \mapsto \quad a_- |\psi_0\rangle = 0$$

■ Note that solving this ODE yields the solution

$$\psi_0 = C \exp\left(-\frac{m\omega x^2}{2\hbar}\right)$$

- It appears that this is how we intuitively derive the ansatz we used last Friday!
- Now we start on some new content.
- Observe that

$$\frac{2m\omega\hat{\vec{x}}}{\sqrt{2\hbar m\omega}} = a_{+} + a_{-}$$
$$\hat{\vec{x}} = \sqrt{\frac{\hbar}{2m\omega}}(a_{+} + a_{-})$$

• In classical mechanics, the solution to the harmonic oscillator is

$$x(t) = A\sin\omega t + B\cos\omega t$$

- We now investigate the observables of  $|\psi\rangle$ .
- To start with, we show how  $\langle \psi | \hat{x} | \psi \rangle$  varies with time. This will lead into a discussion of something called coherent states. Let's begin.
  - We start with

$$\langle \psi | \hat{\vec{x}} | \psi \rangle = \sum_{m,n=0}^{\infty} c_m^* c_n e^{i(E_m - E_n)t/\hbar} \langle \psi_m | \hat{\vec{x}} | \psi_n \rangle$$

- We can algebraically manipulate the above to

$$\langle \psi | \hat{\vec{x}} | \psi \rangle = \sum_{m,n=0}^{\infty} c_m^* c_n e^{i(\hbar \omega (m-n))t/\hbar} \sqrt{\frac{\hbar}{2m\omega}} \left( \sqrt{n+1} \delta_{m,n+1} + \sqrt{n} \delta_{m,n-1} \right)$$

$$= \sum_{n=0}^{\infty} c_{n+1}^* c_n e^{i\omega t} \sqrt{\frac{\hbar}{2m\omega}} \sqrt{n+1} + \sum_{n=1}^{\infty} c_{n-1}^* c_n e^{-i\omega t} \sqrt{\frac{\hbar}{2m\omega}} \sqrt{n}$$

$$= \sum_{n=0}^{\infty} c_{n+1}^* c_n e^{i\omega t} \sqrt{\frac{\hbar}{2m\omega}} \sqrt{n+1} + \sum_{n=0}^{\infty} c_n^* c_{n+1} e^{-i\omega t} \sqrt{\frac{\hbar}{2m\omega}} \sqrt{n+1}$$

$$= \sqrt{\frac{\hbar}{2m\omega}} \cos(\omega t) \left[ \sum_{n=0}^{\infty} \left( c_{n+1}^* c_n + c_n^* c_{n+1} \right) \sqrt{n+1} \right]$$

$$+ \sqrt{\frac{\hbar}{2m\omega}} \sin(\omega t) \left[ \sum_{n=0}^{\infty} \left( c_{n+1}^* c_n - c_n^* c_{n+1} \right) \sqrt{n+1} \right]$$

- Thus,

$$\langle \psi | \hat{\vec{x}} | \psi \rangle = A \cos \omega t + B \sin \omega t$$

where

$$A = 2 \operatorname{Re} \left[ \sum_{n=0}^{\infty} c_{n+1}^* c_n \sqrt{n+1} \right] \sqrt{\frac{\hbar}{2m\omega}} \qquad B = 2 \operatorname{Im} \left[ \sum_{n=0}^{\infty} c_{n+1}^* c_n \sqrt{n+1} \right] \sqrt{\frac{\hbar}{2m\omega}}$$
$$= \operatorname{Re} \left[ \sum_{n=0}^{\infty} c_{n+1}^* c_n \sqrt{n+1} \right] \sqrt{\frac{2\hbar}{m\omega}} \qquad = \operatorname{Im} \left[ \sum_{n=0}^{\infty} c_{n+1}^* c_n \sqrt{n+1} \right] \sqrt{\frac{2\hbar}{m\omega}}$$

- Now for large values of n,

$$\sqrt{n+1}\sqrt{\frac{2\hbar}{m\omega}} = \sqrt{\frac{2\hbar\omega(n+1)}{m\omega^2}} \approx \sqrt{\frac{2E_n}{m\omega^2}}$$

where

$$E_n = \hbar\omega \left(n + \frac{1}{2}\right)$$
  $x = A\sin\omega t$   $E = \frac{m\omega^2 A^2}{2}$   $A = \sqrt{\frac{2E}{m\omega^2}}$ 

- How can we just ignore the real and imaginary sum terms??
- Now take the harmonic oscillator. Notice that  $\sum_n$  is dominated by large values of  $n \approx \bar{n}$ , close to  $\bar{n}$ , where  $\bar{n} \gg 1$ . Thus,

$$\langle \psi | \hat{\vec{x}} | \psi \rangle = \sqrt{\frac{2E\bar{n}}{m\omega^2}} \sum_{n=0}^{\infty} \text{Re} \left[ \sum c_{n+1}^* c_n \right] \sin \omega t$$

and

$$\langle \psi | \hat{\vec{x}}^2 | \psi \rangle - (\langle \psi | \hat{\vec{x}} | \psi \rangle)^2 \neq 0$$

- This is *not* classical motion.
- The states that come closest to realizing classical motion are called **coherent states**.
- Coherent state (of the harmonic oscillator): A state in which the uncertainty in  $\hat{\vec{x}}$  is minimized. Denoted by  $|\alpha\rangle$ .
- It turns out that the coherent states of the harmonic oscillator are the eigenstates of the lowering operator. Denoting the corresponding eigenvalue by  $\alpha$ , we have that

$$a_{-} |\alpha\rangle = \alpha |\alpha\rangle$$

- Aside:  $|\alpha\rangle$  can surely be expressed as a linear combination of the  $\psi_n$ . What does the lowering operator do to  $\psi_0$ , in particular, should it have a nonzero coefficient?
  - It acts as follows, simply zeroing it out.

$$a_{-}\left|\psi_{0}\right\rangle = 0\left|\psi_{0}\right\rangle$$

- Now what is  $|\alpha\rangle$ ?
- Well, for a state to be coherent, we must have

$$\begin{split} &\frac{\hbar}{2} = \sigma_x^2 \\ &= \langle \alpha | \hat{\vec{x}}^2 | \alpha \rangle - (\langle \alpha | \hat{\vec{x}} | \alpha \rangle)^2 \\ &= \frac{\hbar}{2m\omega} \left[ \langle \alpha | (a_+ + a_-)^2 | \alpha \rangle - (\langle \alpha | (a_+ + a_-) | \alpha \rangle)^2 \right] \\ &= \frac{\hbar}{2m\omega} \left[ \langle \alpha | a_+^2 + a_+ a_- + a_- a_+ + a_-^2 | \alpha \rangle - (\langle \alpha | (a_+ + a_-) | \alpha \rangle)^2 \right] \\ &= \dots \end{split}$$

- We'll finish this up next time.
- Is it really  $\hbar/2$  here??

### 4.3 Hermitian Operators; Position and Momentum Eigenstates

1/26: • Recap of the harmonic oscillator.

- The Hamiltonian (in terms of  $\hat{p}, \hat{x}$ ; and in terms of  $a_+, a_-$ ).
- The definitions of  $a_+, a_-$ .
- The effect of  $a_+, a_-$  on  $|n\rangle := |\psi_n\rangle$ .
- The effect of  $\hat{H}$  on  $|n\rangle$ .
- Adjoints of the **ladder operators**:

$$(a_{+})^{\dagger} = a_{-}$$
  $(a_{-})^{\dagger} = a_{+}$ 

- The commutator  $[a_-, a_+] = 1$ .
- The formula for a generic state  $|\psi\rangle$ , i.e.,

$$|\psi\rangle = \sum_{n=0}^{\infty} c_n e^{-iE_n t/\hbar} |n\rangle$$

- This will of course appear as a question in the midterm and final!
- We must also remember that

$$1 = \langle \psi | \psi \rangle = \sum_{n=0}^{\infty} |c_n|^2 \qquad 1 = \langle \psi | \hat{H} | \psi \rangle = \sum_{n=0}^{\infty} |c_n|^2 E_n$$

- The probability of measuring the energy of  $|\psi\rangle$  as  $E_n$  is  $|c_n|^2$ .
  - So when we perform a measurement, the energy of  $|\psi\rangle$  collapses to that of one eigenstate.
- Ladder operator: An element in the class of operators that send  $|n\rangle$  to scalar multiples of  $|n+i\rangle$  for some  $i \in \mathbb{Z} \setminus \{0\}$ .
  - The raising and lowering operators are ladder operators!
- The midterm.
  - -50% of the midterm will be related to harmonic oscillator content, esp. the last few equations above following the definition of  $|\psi\rangle$ .
  - The midterm will only cover what we covered through today.
  - The midterm may be on February 5. It sounds like it will be on Friday, February 9, though.
  - It will take place in this classroom.
  - It will be open book.
    - Can we bring virtual notes, or does everything have to be printed out??
  - The midterm questions will be the same level as the PSet questions; there may even be some repetition! Def take a look at the PSets.
  - PSet 1 through PSet 4 will be covered on the midterm.
  - Foundations of quantum mechanics plus one-dimensional problems.
  - We will be allowed to turn in the midterm through 1:00 PM, though it shouldn't take us more than 50 minutes.
- The first two problems of PSet 4 must be solved; the third one can be dropped or can be solved for 5 bonus points.
- We now begin on new content.

• Recall the following expression from last class.

$$\langle \psi | \hat{\vec{x}} | \psi \rangle = \sqrt{\frac{2\hbar}{m\omega}} \sum_{n=0}^{\infty} \left[ \sqrt{n+1} \cos(\omega t) \operatorname{Re}(c_{n+1}^* c_n) + \sqrt{n+1} \sin(\omega t) \operatorname{Im}(c_{n+1}^* c_n) \right]$$

- This is a really complicated expression, especially as we prepare to talk about coherent states.
- Thus, it was quite difficult to prove that

$$\langle \psi | \hat{\vec{x}}^2 | \psi \rangle \neq (\langle \psi | \hat{\vec{x}} | \psi \rangle)^2$$

- Can we introduce a notation that will allow us to work with this expression and similar ones more easily?
- Wagner restates the definition of a coherent state and and the uncertainty principles.
- Recall that

$$a_{-}|\alpha\rangle = \alpha |\alpha\rangle$$

and that

$$|\alpha\rangle = \sum_{n} c_n |n\rangle$$

• The Hermitian conjugate of  $a_-$  is  $a_+$  and hence, the Hermitian conjugate of  $a_- |\alpha\rangle$  is

$$\langle \alpha | a_+ = \langle \alpha | \alpha^*$$

• Thus, since  $\langle \alpha | \alpha \rangle = 1$ 

$$\langle \alpha | a_+ a_- | \alpha \rangle = \alpha \, \langle \alpha | a_+ | \alpha \rangle = \alpha \, \langle \alpha | \alpha^* | \alpha \rangle = \alpha^* \alpha \, \langle \alpha | \alpha \rangle = \alpha^* \alpha$$

- We now seek to verify that an eigenstate of  $a_-$  does, in fact, minimize the uncertainty in  $\hat{x}$ .
  - For simplicity, we will consider  $|\alpha\rangle$  at t=0 (this will remove the complex exponential from calculations).
  - First off, we have that

$$\langle \alpha | \hat{\vec{x}} | \alpha \rangle = \sqrt{\frac{\hbar}{2m\omega}} \langle \alpha | (a_+ + a_-) | \alpha \rangle = (\alpha^* + \alpha) \sqrt{\frac{\hbar}{2m\omega}}$$

and

$$\langle \alpha | \hat{\vec{x}}^{2} | \alpha \rangle = \frac{\hbar}{2m\omega} \langle \alpha | (a_{+} + a_{-})(a_{+} + a_{-}) | \alpha \rangle$$

$$= \frac{\hbar}{2m\omega} [\langle \alpha | a_{+}^{2} | \alpha \rangle + \langle \alpha | a_{+} a_{-} | \alpha \rangle + \langle \alpha | a_{-} a_{+} | \alpha \rangle + \langle \alpha | a_{-}^{2} | \alpha \rangle]$$

$$= \frac{\hbar}{2m\omega} [(\alpha^{*})^{2} \underbrace{\langle \alpha | \alpha \rangle}_{1} + \alpha^{*} \alpha + \langle \alpha | \underbrace{(a_{-} a_{+} - a_{+} a_{-} + a_{+} a_{-}) | \alpha \rangle}_{1} + \alpha^{2}]$$

$$= \frac{\hbar}{2m\omega} [(\alpha^{*})^{2} + \alpha^{2} + 2|\alpha|^{2} + 1]$$

- Combining these, we have that

$$\langle \alpha | \hat{\vec{x}}^2 | \alpha \rangle - (\langle \alpha | \hat{\vec{x}} | \alpha \rangle)^2 = \frac{\hbar}{2m\omega} [(\alpha^*)^2 + \alpha^2 + 2|\alpha|^2 + 1 - (\alpha^*)^2 - \alpha^2 - 2|\alpha|^2] = \frac{\hbar}{2m\omega}$$

- Second, we have that

$$\langle \alpha | \hat{\vec{p}} | \alpha \rangle = \sqrt{\frac{\hbar m \omega}{2}} \langle \alpha | (a_{+} - a_{-}) | \alpha \rangle = \sqrt{\frac{\hbar m \omega}{2}} (\alpha^{*} - \alpha)$$

and

$$\begin{split} \langle \alpha | \hat{\vec{p}}^2 | \alpha \rangle &= -\frac{\hbar m \omega}{2} \left\langle \alpha | (a_+ - a_-)(a_+ - a_-) | \alpha \right\rangle \\ &= -\frac{\hbar m \omega}{2} \left[ (\alpha^*)^2 + \alpha^2 - |\alpha|^2 - \left\langle \alpha | \underbrace{a_- a_+}_{a_+ a_- + 1} | \alpha \right\rangle \right] \\ &= -\frac{\hbar m \omega}{2} \left[ (\alpha^*)^2 + \alpha^2 - 2|\alpha|^2 - 1 \right] \end{split}$$

- Combining these, we have that

$$\langle \alpha | \hat{\vec{p}}^2 | \alpha \rangle - (\langle \alpha | \hat{\vec{p}} | \alpha \rangle)^2 = \frac{\hbar m \omega}{2} \left[ -(\alpha^*)^2 - \alpha^2 + 2|\alpha|^2 + 1 + (\alpha^*)^2 + \alpha^2 - 2|\alpha|^2 \right] = \frac{\hbar m \omega}{2}$$

- Therefore,

$$\sigma_p^2 \sigma_x^2 = \frac{\hbar m\omega}{2} \cdot \frac{\hbar}{2m\omega}$$
$$= \frac{\hbar^2}{4}$$
$$\sigma_p \sigma_x = \frac{\hbar}{2}$$

as desired.

• If we reassert full time dependence, we obtain

$$|\alpha\rangle(t) = \sum_{n} c_n e^{-iE_n t/\hbar} |n\rangle$$

- Then

$$a_{-} |\alpha\rangle = \sum_{n=0}^{\infty} c_n e^{-iE_n t/\hbar} \sqrt{n} |n-1\rangle$$
$$= \sum_{n=0}^{\infty} c_{n+1} e^{-iE_{n+1} t/\hbar} \sqrt{n+1} |n\rangle$$

- And recall that

$$a_{-} |\alpha\rangle = \alpha |\alpha\rangle$$

- Thus, via term-by-term transitivity for each  $|n\rangle$ ,

$$\alpha c_n = c_{n+1} e^{-i(E_{n+1} - E_n)t/\hbar} \sqrt{n+1}$$
  
$$\alpha c_n = c_{n+1} e^{-i\omega t} \sqrt{n+1}$$

- We can continue on with this recurrence relation to find a formula for all coefficients  $c_n$ , from which we can define  $|\alpha\rangle$  explicitly as a linear combination of the  $|n\rangle$ .
- If  $\alpha$  is real and  $\psi_{\alpha}(x)$  denotes the time-independent factor in  $|\alpha\rangle$ , then

$$a_-\psi_\alpha(x) = \alpha\psi_\alpha(x)$$

$$\left[\hbar \frac{\mathrm{d}}{\mathrm{d}x} + m\omega x\right] \psi_{\alpha}(x) = \alpha \psi_{\alpha}(x)$$

- Then

$$\frac{1}{\psi_{\alpha}} \frac{\mathrm{d}}{\mathrm{d}x} \psi_{\alpha} + \left( \frac{m\omega x}{\hbar} - \alpha \right) = 0$$

- Thus, solving the differential equation, we obtain

$$\psi_{\alpha} = \exp\left[-\frac{m\omega}{2\hbar}(x - \langle x \rangle)^2\right]$$

which is a Gaussian.

Therefore,

$$a_{-}|0\rangle = 0|0\rangle$$

- We will program the time evolution of a coherent state in Python or Mathematica??
  - A real wave function is a crazy thing that does flip from side to side at T/2 and T.
    - Essentially,

$$|\psi(x,t)|^2 = |\psi(-x,t+T/2)|^2$$

- A coherent state is just a Gaussian that oscillates back and forth to both sides of the y-axis.

### 4.4 G Chapter 2: Time-Independent Schrödinger Equation

From Griffiths and Schroeter (2018).

#### Section 2.3: The Harmonic Oscillator

1/29: • Sets up the relevant TISE, as in class.

- Note that "it is customary to eliminate the spring constant in favor of the classical frequency" (Griffiths & Schroeter, 2018, p. 58).
- Goes through the ladder operator method in great detail and very coherently; I should probably return!!
  - There is a proof in here of why  $a_{+}^{\dagger} = a_{-}$ .
- Goes through the **power series method** from the Lecture 7 notes.
  - This is the brute force method, though it is useful (as with the hydrogen atom later on).
- Canonical commutation relation: The relation defined as follows. Given by

$$[\hat{x},\hat{\vec{p}}]=i\hbar$$

#### Section 2.4: The Free Particle

• Relevant to 1/5 and 1/17 discussions; I should probably return!!

#### Section 2.5: The Delta-Function Potential

• Relevant to PSet 2; I should probably return!!

#### Section 2.6: The Finite Square Well

• Relevant to PSet 2; I should probably return!!

## 4.5 G Chapter 3: Formalism

From Griffiths and Schroeter (2018).

### Section 3.1: Hilbert Space

- Purpose: Recast some of the miracles we've encountered thus far in more powerful terms.
- Lots of stuff I should read just for fun (tons of answers to questions I've wondered at over the years), and some stuff actually related to in-class discussions of Hermitian operators, compatible operators, proving the uncertainty principle, Gaussian wave packets, the Ehrenfest theorem, Dirac notation, etc.

### 4.6 G Appendix: Linear Algebra

From Griffiths and Schroeter (2018).

• A terrific review of relevant concepts, all expressed in Dirac notation.

### 4.7 T Chapter 7: The One-Dimensional Harmonic Oscillator

From Townsend (2012).

### Section 7.7: Time Dependence

• There is some stuff here on  $|\psi(x,t)|^2 = |\psi(-x,t+T/2)|^2$ .

#### Section 7.8: Coherent States

- Coherent state: A superposition of energy eigenstates of the harmonic oscillator that is also an eigenstate of the lowering operator. Denoted by  $|\alpha\rangle$ .
- $\alpha$ : The eigenvalue corresponding to the coherent state  $|\alpha\rangle$ .
  - Since  $a_{-}$  is not Hermitian,  $\alpha$  need not be real.
- Coherent states "come closest to representing classical electromagnetic waves with a well-defined phase" (Townsend, 2012, p. 263).
  - For a harmonic oscillator, they come "closest to the classical limit of a particle oscillating back and forth in a harmonic oscillator potential" (Townsend, 2012, p. 263).
- Coherent states were first derived by Schrödinger when he was looking for solutions to the Schrödinger equation that satisfy the **correspondence principle**.
- Correspondence principle: The behavior of systems described by the theory of quantum mechanics reproduces classical physics in the limit of large quantum numbers.
- Townsend (2012) completes Wagner's derivation of  $|\alpha\rangle$  as a linear combination of the  $|n\rangle$ .
- Time Evolution of a Coherent State.
- Repeat of the derivation of the minimum uncertainty from class.
- Shows that the ground coherent state is an oscillating Gaussian.

#### 4.8 L Section 23: The Linear Oscillator

From Landau and Lifshitz (1977).

• The solution to Problem 3 has Schrödinger's derivation of which wave functions minimize the uncertainty relation.
